DNS Onboarding Document

Note:- A DNS project should have knowledge of the Domain, Domain Record and API

★ What is DNS :-

- DNS stands for **D**omain **N**ame **S**ystem.
- Mainly Used is convert human friendly domain name (www.google .com) into IP address.
- DNS is a directory service that provides a mapping between the name of a host on the network and its numerical address.
- User can know in depth about DNS by using below link : https://www.javatpoint.com/computer-network-dns

★ What is Marcaria DNS Application Use :-

- DNS servers convert URLs and domain names into IP addresses that computers can understand and use. They translate what a user types into a browser into something the machine can use to find a webpage. This process of translation and lookup is called *DNS resolution*.
- The process of DNS resolution involves converting a hostname (such as www.example.com) into a computer-friendly IP address (such as 192.168.1.1). An IP address is given to each device on the Internet, and that address is necessary to find the appropriate Internet device.
- User can know in depth about how to DNS work by using below link : https://www.techtarget.com/searchnetworking/definition/domain-name-system

★ What is API :-

- APIs are mechanisms that enable two software components to communicate with each other using a set of definitions and protocols.
- For example, the weather bureau's software system contains daily weather data. The weather app on your phone "talks" to this system via APIs and shows you daily weather updates on your phone.
- User can know in depth about What is API by using below link :

https://aws.amazon.com/what-is/api/

★ What are API integrations?

- API integrations are software components that automatically update data between clients and servers. Some examples of API integrations are when automatic data sync to the cloud from your phone image gallery, or the time and date automatically sync on your laptop when you travel to another time zone. Enterprises can also use them to efficiently automate many system functions.

★ How many tools are there to test API's?

- Postman, Swagger, SoapUI, Apache JMeter, Katalon Studio, Apigee, API Fortress, Tricentis Tosca, Appium, Gatling, BlazeMeter, Runscope, Sauce Labs, Loader.io, SOAtest, Karate DSL.

★ Which tool are we currently using in API testing ?

- Currently we can use swagger to test the DNS API's.
- User can know in depth about Swagger by using below link : : https://dns-api-qa.nominus.com/swagger/ui/index#/

★ Use Of API's :-

- Here, the user API is used to create, read, update and delete the domain, creating records within the domain.
- Users can run all these APIs through Swagger.

★ Branches:-

Sr.No.	Branch name	Use
1	Dev-backup	Dev

2	Integration	QA/ Production (**do not make any changes in this branch.**)
3	Main	Main (**do not make any changes in this branch.**)

➔ DEVELOPMENT Site for accessing Marcaria DNS application :

- https://admin-dns-api-dev.nominus.com
- This site is accessible only for the Development team.

➔ QA Site for accessing Marcaria DNS application :

- https://admin-dns-api-qa.nominus.com
- This site is accessible only for the QA and Development team.

➔ Staging Site for accessing Marcaria DNS application :

- https://admin-dns-api.marcaria.net/
- This site is accessible only for the Developer team.

➔ Production Site for accessing Marcaria DNS application :

- https://admin-dns-api.nominus.com
- This is the production site URL.
- **So do not add any data or any changes in this URL. This URL should only be used by the Developers.**
